Abstract

The research is mainly focused the working capital efficiency of food processing industry in India. In this research, the five companies have been taken for analysis. The purposive sampling techniques have been used. The debt equity ratio, current ratio, debtor turnover ratio, interest coverage ratio, return on capital employed ratio, etc., have been used to measure the financial performance of the selected companies. The OLS model has been used to check the relationship among the independent and dependent variables and its impact. The correlation matrix has been used to measure the relationship among the variables. The findings and suggestions would be useful for further researcher and corporate people to improve their working capital efficiency.
